Edge Clips

How are the edge clips installed?

All Edge Clips feature a self-locking fastening mechanism. To install the clip, simply snap it onto the edge of the profile or module without using any tools. Once installed, the Edge Clip must be secured firmly in place and must not come loose from the edge on its own.

+ Edge Clip (03-001885)

The Edge Clip is mounted parallel to the module edge and allows for neat cable routing along the module frame. Depending on the cable diameter, up to three solar cables can be securely held and fastened.

+ Coupler Edge Clip (03-001886)

The Coupler Edge Clip allows connected solar connectors to be securely fastened directly to the module frame. The connectors are positioned in the retaining channels and held securely in place.

+ Cable Tie Edge Clip 0°/45°/90° (03-001887)

The cable tie head can be rotated (0°, 45°, 90°) for optimal cable routing. Insert the solar cable into the loop and tighten the cable tie. The loop can be opened again if necessary.
